How the website works

For local business owners and the operations team.

Goal: help a local business get discovered, turn enquiries into customers, retain them and review growth. The website's customer is the business owner—not the end consumer booking a clinic or salon visit.

Today: the Vercel site is a public design/demo preview. Real audit submissions, individual sign-in and private operations require the full backend with persistent storage. External messaging, booking, payment, Google and AI services are not connected.

Frontend and navigation

A shared header/footer surrounds the pages. Desktop dropdowns and the mobile menu reach the same destinations. Forms validate before calling the server. Practice records stay in the browser; enabled real account activity is stored separately on the server.

Go to	Purpose
Home / Solutions	Understand the offer and four growth pillars.
Industries / How it works	Choose dental, salon or fitness; understand delivery.
Plans	Compare indicative options and calculator scenarios.
Get a growth audit	Business details → contact/permission → review.
Explore the demo	Growth overview, enquiries, reviews, visibility, onboarding.
Footer	Privacy, build readiness and Team operations desk (/ops).

Customer: the path to an agreed plan

1. Understand. Home → Solutions. Identify discovery, conversion, retention or measurement as the priority.

2. Find your fit. Industry → How it works → Plans. Options are indicative; there is no checkout.

3. Request an audit when enabled. Complete the three steps and submit. A saved reference means received, not an appointment booked.

4. Agree the work. The team follows up manually, reviews opportunities and agrees scope, access, delivery and commercial terms outside the app.

5. Explore the workspace. Try enquiry states, review drafts and checklists. These remain practice workflows, including after account sign-in.

Login, activity and operations

Customer login and the activity calendar

Demo: open Explore the demo → Growth overview → Demo profiles. No login is needed. Choose “Act as”, perform actions in the existing sections, then return to the heatmap. Filter by profile and 30/90/365 days; select a day to view events.

Real account, on an enabled backend: My real activity → Create an account. Enter name, email, a password of at least 12 characters and agreement to activity recording. Existing users choose Sign in. Successful logins and workspace interactions appear in your own private history. Sign out, Clear history and Delete account are available. Email verification and password recovery are not implemented.

Read the heatmap: Quiet 0 · Light 1–2 · Steady 3–5 · Active 6–9 · Busy 10+ actions/day. Dates use India time. These are feature-use counts—not evidence of bookings, revenue, productivity or retention.

Admin: the path from request to follow-through

1. Prepare hosting. The operator enables persistent storage and HTTPS, sets PUBLIC_ORIGIN and a strong OPS_PASSWORD, and optionally ENABLE_USER_ACCOUNTS=true. Test persistence before inviting customers.

2. Sign in at /ops. Use the configured operations password. This is separate from customer email/password login; it is not a full role-based administration console.

3. Review. Search/filter requests, check business details and contact permission, set New → Reviewing, and save notes.

4. Follow up. Contact the owner outside the app. Set Contacted after outreach and record agreed next steps. Use Completed when the audit request is handled—not as proof of growth.

5. Maintain the queue. Save updates and export a filtered CSV if needed. The desk does not manage customer passwords, organization roles, subscriptions or all users’ heatmaps.

What to do next to achieve the business goal

First: enable durable intake and accounts. Next: validate the manual audit → proposal → onboarding → review process with a small pilot. Then: connect the providers needed for delivery and measure qualified enquiries, attended bookings, repeat visits and revenue using authorized source data.

Live preview: local-lanchers-v22.vercel.app

Prepared from the V2.2 source and release notes. Higgsfield was unavailable in this session; the companion presentation was generated locally.
